The present invention describes composition of matter (I) comprising an (XI)a-FI-(X2)b, where FI = an FC domain; XI and X2 = are each independently selected from -(LI)c-PI-(LI)c-PI-(LI)d-P2.

(LI)c-PI-(LI)d-P2-(LI)e-P2, or -(LI)c-PI-(LI)d-P2-(LI)e-P3-(L4)f-P4 where PI, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides: L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities: DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                 Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TRF: antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytocoxic T cell lymphocyte antigen 4; tumour neorosis factor; vascular endothelial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases -

The present invention describes composition of matter (I) comprising an Fr domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a=F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)C-P1-(L2)d-P2.

(L0)c-P1-(L2)d-P2-(L3)d-P3, or -(L1)C-P1-(L2)d-P2-(L3)d-P3-(L3)d-P3-(L4)f-P4 are each independently sequences of the peptides: L1, L2, L3, and L4 = are each independently active peptides: L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and host cells from the present invention can carriage of a producing pharmaceutical compositions. The compositions are be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein composition composition composition complement fixation, and possibly placental transfer. AAA69443 complement seemplification of the present invention.
                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        autolmmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; minetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is:

EC (XI)a-FI-(X2)b, where: FI = an FC domain; XI and X2 = are each independently selected from -(L1)C-PI-(L2)d-P2.

Independently Selected from -(L1)C-PI-(L2)d-P2-(L3)d-P2.

CC (L1)C-PI-(L2)d-P2-(L3)d-P3, or -(L1)C-PI-(L2)d-P2-(L3)e-P3-(L4)f-P4

CC where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently interestive antiasthmatic, thrombolytic and immunosuppressive continuities. DNAS, vectors and host cells from the present invention can extivities DNAS, vectors and host cells from the present invention can cell for producing pharmaceutical compositions. The compositions are used for producing pharmaceutical compositions, or autoimmune diseases.

CC be used for producing pharmaceutical compositions are used in FC domain (rather than a Fab domain) can provide a longer to Alf-life or incorporate functions such as FC receptor binding, protein a binding, complement fixation, and possibly placental transfer. AAA69443

CC sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes composition of matter (1) comprising an Probability parmacologically active peptides, and linkers. Where (1) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-F1-(L2)d-P2.

(L1)c-P1-(L2)d-P2-(L3)e-P^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of parmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently of or 1, provided that at least 1 of a and b 1s1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein and particles and Amble955 and Amble955 and Amble955 and Amble955 and Amble955 and pacental transfer. Amade9443 sequences used in the exemplification of the present invention.
to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiathmatic; thrombolytic; VEGF; immunosuppresalve; EPO; TPO; CTLA4; mimetic; IL-1; TPF; antagonist; MMF; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour neorosis factor; vascular endothelial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

The present invention describes composition of matter (I) comprising an Ec domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain, X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2, (L3)e-P3. (L4)e-P2-(L3)e-P3. (L4)e-P2-(L3)e-P3. (L4)e-P2-(L3)e-P3. The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where F1 = an Fc domain, X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2, (L1)c-P1-(L2)d-P2, (L1)c-P1-(L2)d-P2, (L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L3)d-P2-(L3)e-P3, or -(L1)c-P1-(L3)d-P2-(L3)e-P3, or -(L1)c-P1-(L3)d-P2-(L3)e-P3, or -(L1)c-P1-(L3)d-P2-(L3)e-P3, or -(L1)c-P1-(L3)d-P2-(L3)e-P3, or -(L1)c-P1-(L3)d-P2-(L3)e-P3, or -(L1)c-P1-(L3)d-P3, or -(L3)e-P3, or 
useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA6943 to AAA69526 and AAB18035 to AAAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; exythropoletin; thrombopoletin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)C-P1 -(L2)C-P2-(L3)-P2.

(L1)C-P1-(L2)d-P2.

(L1)C-P1-(L2)d-P2.

(L2)d-P2.

(L3)e-P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently have explosible that at least 1 of a and b is 1. The composition can have explosible triasthmatic, thrombolytic and immunosuppressive cutivities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are used for producing pharmaceutical compositions. The compositions are used for producing cancer, asthma, thrombosis, or autoimmune diseases.

The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein a binding, complement fixation, and possibly placental transfer. AAA69443
                                                                                                                                                                                              ή:
half-life or incorporate functions such as Fc receptor binding, protein
                     A binding, complement fixation, and possibly placental transfer. AAA69442 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes composition of matter (I) comprising an (X1)a-F1-(X2)b, where F1 = an FC domain, X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2.
-(L1)c-P1-(L2)d-P2-(L3)e-P^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides: L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2, (L3)e-P2, (L4)e-P1-(L2)d-P2, (L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 pharmacologically active peptidess: L1, L2, L3, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently independently at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L3)e-P3, or -(L1)c-P1-(L2)d-P2, (L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently independently linkers; and a, b, c, d, e, and f = are each independently or L1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive
have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.

activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker.

The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from (Li)c-P1, -(Li)c-P1-(L2)d-P2, (L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently
                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

                                                                                                                                                                                                                                                                                                                                  useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (Xl)a-F1-(X2)b, where: F1 = an Fc domain; Xl and X2 = are each independently selected from -(L1)c-P1-(L1)d-P2-(L3)d-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-(L3)q-P2-

                                                                                          The present invention describes composition of matter (1) comprising an (X1)a-F1-(X2)b, where F1 = an Fc domain, X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2.

-(L1)c-P1-(L2)d-P2-(L3)e-F^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L3)e-F^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L3)e-F^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently necessaries or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are
                                                                                                                                                                                                                                                                                                                                     useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

The TMPs are useful for increasing the production of platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g. aplastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency
                                                                                                                                                                                                             A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP] (L_1)_nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least 10 to 14 residues in length comprising X_2 \cdot X_1 = 0, X_2 \cdot X_1 = 0, X_1 \cdot X_1
                                                                                 Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Ec domain, pharmacologically active peptides, and linkers. Where (I) is:

(XI)=T-(XZD), where: FI = an FC domain; XI and X2 = are each

(XI)=T-(XZD), where: FI = an FC domain; XI and X2 = are each

(C) independently selected from -(LI)-FI - (LI)-FPI-(LZD)-FP.

(C) redependently selected from -(LI)-FI - (LI)-FPI-(LZD)-FP.

(C) pharmacologically active peptides; LI, L2, L3, and L4 = are each

(C) pharmacologically active peptides; LI, L2, L3, and L4 = are each

(C) cor I, provided that at least I of a and b is I. The composition can

(C) or I, provided that at least I of a and b is I. The composition can

(C) cor i, provided that at least I of a cor and immosuppressive

(C) or I, provided that at least I of a cor and invention can

(C) cor i, provided that at least I of a cor and invention can

(C) cor i, provided that at least I of a cor and invention can

(C) cor i, provided that at least I of a cor and invention can

(C) cor i, provided that at least I of a cor and invention can

(C) cor i, provided that at least I of a cor and invention can

(C) cor i, provided that at least I of a cor and invention can

(C) cor i, corporate functions such as FC receptor binding, protein

(C) The use of an FC domain (rather than a Fab domain) can provide a longer

(C) C) cor incorporate functions such as FC receptor binding, protein

(C) Abinding, complement fixation, and possibly placental transfer. AbA69443

(C) sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     autoimmune disease, cytostatic, antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMF; inhibitor; erythropoiethin; thrombopoiethin; interleukin 1; cytotxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.
Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modified peptide; therapeutic agent; fusion; Fc domain; cancer;

The present invention describes composition of matter (I) comprising an (X1) a F1-(X2)b, where F1 = an Fc domain; X1 and X2 = are each independently selected from (L1)c-P1-(L2)d-P2, (L1)c-P1-(L2)d-P2, (L1)c-P1-(L2)d-P2, (L1)c-P1-(L2)d-P2, (L2)d-P2, (L3)c-P3, or (L1)c-P1-(L2)d-P2-(L3)e-P3, or (L1)c-P1-(L2)d-P2-(L3)e-P3, ord P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fe domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fe receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69442 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4; Gaps
Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 185; DB 21; Length 40;

The present invention describes composition of matter (I) comprising an Cr domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-F1. (L1)c-F1-(L2)d-F2.

(L1)c-F1-(L2)d-F2.

(L3)d-F2. F3, and P4 = are each independently sequences of where P1, P2. P3, and P4 = are each independently active peptides: L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and bass 1 of a and b is 1. The composition can carriage expressive and sequences of corrections of the compositions are cactivities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

CC be used for producing pharmaceutical compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

CC half-life or incorporate functions such as Fc receptor binding, protein and possibly placental transfer. AAA69443

CC sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker; cyclic; linear.
                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention describes composition of matter (1) comprising an (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(11)c-P1, -(12)d-P2-(13)d-P2-(13)e-P3-(14)f-P4 (11)c-P1-(12)d-P2-(13)e-P3-(14)f-P4 (11)c-P1-(12)d-P2-(13)e-P3-(14)f-P4 (14)f-P4-(12)d-P2-(13)e-P3-(14)f-P4 (14)f-P4-(12)d-P2-(13)e-P3-(14)f-P4 (14)f-P4-(12)d-P3-(14)f-P4-(12)d-P3-(14)f-P4-(12)d-P3-(14)f-P4-(12)d-P3-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4-(14)f-P4

```
half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA6943 to AAA69526 and AAB18055 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein

Fe domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an Fe domain; X1 and X2 = are each
independently selected from -(L1)c-P1-(L2)d-P2-(L3)d-P2.

-(L1)c-P1-(L2)d-P2-(L3)e-P3-(L3)e-P3-(L4)f-P4
where P1, P2, P3, and P4 = are each independently sequences of
the pharmacologically active peptides; L1, L2, L3, and L4 = are each
independently linkers; and a, b, c, d, e, and f = are each independently
to or 1, provided that at least 1 of a and b is 1. The composition can
have eytostatic, antiasthmatic, thrombolytic and immunosupressive
activities. DNAs, vectors and host cells from the present invention can
be used for producing pharmaceutical compositions. The compositions are
useful for treating cancer, asthma, thrombosis, or autoimmune diseases.
The use of an Fe domain (rather than a Feb domain) can provide a longer
half-life or incorporate functions such as Fe receptor binding, protein
A binding, complement fixation, and possibly placental transfer. AAA69443
centuances used in the evamalification effective and amino acid
                                                                                                                                The present invention describes composition of matter (I) comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive: EPO; TPO; CTLA4: mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.
                  Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0

Novel composition of matter comprising an Fc domain and

```
C domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
independently selected from -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L3)e-P3-(L4)f-P4

(L1)c-P1-(L2)d-P2-(L3)e-P3-yr -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4

where P1, P2, P3, and P4 = are each independently sequences of
pharmacologically active peptides; L1, L2, L3, and L4 = are each
independently linkers; and a, b, c, d, e, and f = are each independently
independently linkers; and a, b, c, d, e, and f = are each independently
c) or 1, provided that at least 1 of a and b is 1. The composition can
have cytostatic, antiathmatic, thrombolytic and immunosuppressive
activities. DNAs, vectors and host cells from the present invention can
be used for producing pharmaceutical compositions. The compositions are
useful for treating cancer, asthma, thrombosis, or autoimmune diseases.
The use of an Fc domain (rather than a Fab domain) can provide a longer
half-life or incorporate functions such as Fc receptor binding, protein
A binding, complement fixation, and possibly placental transfer. AAA69443

to AAA69526 and AAB16955 to AAB18013 represent unvention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker; cyclic; linear.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
